fragment, homologue complement or allelic variant) encoding a human secreted protein (and its fragment, domain, epitope, variant, secreted fragment, homologue complement or allelic variant) encoding a human secreted protein (and its fragment, domain, epitope, variant, secreted comprising the nucleic as variant). Also included are a recombinant vector comprising the nucleic acid, a recombinant host cell comprising the vector, an antibody against the secreted protein are arecombinant host cell that expresses the secreted protein and a method of identifying a binding partner of the secreted protein. The nucleic acid and protein are used to prevent, diagnose, treat or ameliotate a medical condition in e.g. prevent, diagnose, treat or ameliotate a medical condition in e.g. for example autoimmune diseases e.g. rheumatoid arthritis, clore example autoimmune diseases e.g. rheumatoid arthritis, chyperproliferative disorders e.g. rheumatoid arthritis, cardiovascular disorders e.g. cardiac arrest, cerebrovascular disorders e.g. cardiac arrest, cerebrovascular disorders e.g. corneal infection. Many other diseases and in clasorders are listed in the specification. The polypeptides can also be used to aid wound healing an epithalial cell proliferation, to prevent cused to aid wound healing an epithalial cell proliferation, to regenerate tissues and in chanctaris. The polypeptides can also be used as a food additive chanctaris. The polypeptides can also be used as a food additive chanctaris. The polypeptides can also be used as a food additive chance represents a novel human secreted protein of the invention. invention relates to an isolated nucleic acid molecule (or its

diseases.

Sequence

```
The present sequence is a rat pituitary hormone, pituitrone.

Pituitrone is highly expressed in pituitary gland and is also expressed in pituitary gland and is also expressed in prain tissues, spinal cord and kidney. It may be used as antigens in the production of antibodies against pituitrone and in assays to identify modulators. Pituitrone cDNAs are also useful in gene therapy. Pituitrone may be used in the prevention, treatment and diagnosis of diseases associated with inappropriate pituitrone expression. It may be useful in treating disorders related to reproductive and renal system, immune disorders, disorders of the controlls (e.g., aneamia, ingreders, blood coagulation disorders, autolumune disorders (e.g. addisorders) blood coagulation clisorders, autolumune disorders (e.g. addisorders (SLE)), hyperproliferative disorders (e.g. neoplasms of bone, liver and pancreas) and infectious
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Digeoige syndrome; haematopoietic cell; ataxia telangiectasia; Wiskott-Aldrich disorder; blood coagulation disorder; Addison's disease; autoimmune disorder; multiple sclerosis; systemic lupus erythematosus; SLE; hyperproliferative disorder; gene therapy; neoplasm; infectious disease; immunomodulatory; cytostatic; antimicrobial.

(I) and (II) is also useful for diagnosing lymphoma involving determining the expression of one or more (II), or (I) encoded by (II) in a first tissue type of a first individual and comparing the expression of the gene(s) from a second normal tissue type from the first individual or a second unaffected individual, where a difference in the expression indicates that the first individual has lymphoma. (II) is useful in the comprising (II) is useful for screening drug candidates which involves providing the host cell that expresses LA gene, adding a drug candidate on the contract.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                | SIDSZ/gcgdata/geneseqn-embl/NA1980_DAT:*

                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                               protein used in the method of the invention. Host cells containing the Tango protein are used to produce recombinant proteins for raising antibodies. It is also used in identifying specific binding agents (including cognate receptors), which can be used to determine amounts of recombinant protein in cells or the rapeutifally. Antibodies or other specific binding agents, are used to detect recombinant protein and fragments of the Tango concledes sequence can be used as probes or primers for detecting the Tango gene, specifically mRNA, in usual hybridisation or amplification assays. These assays are used for diagnosis of diseases associated with abnormal expression of Tango proteins, e.g. detecting mutations in the Tango genet; reagments of the Tango conclede aguence are also used for genetic mapping and chromosome identification, and as antisense, ribozyme or tribiar-furning therapeutics. Antibodies may also be used to generate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       540

                                                                                                                                                                                                                                                                                                                                                                                               셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with notropic.

CC the encoded polypeptides (AAM38642-AAM42213) with notropic.

Immunosuppressant and cytostatic activity. The polynucleotides are useful

CC in gene therapy. A composition containing a polypeptide or polynucleotide

CC of the invention may be used to treat diseases of the peripheral nervous

CC system, such as peripheral nervous injuries, peripheral nervous to coalised neuropathy and

CC alzheimer's, Parkinson's disease, Huntington's diseases, such as

CC Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic

CC altisation of the activities such as: Immune system suppression,

CC and thrombolytic activity, cancer diagnosis and therapy, drug screening,

SC Alsorders.

The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, limmunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ä

```
The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral nervous system diseases, such as Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, Activin/inhibin activity, cancer disensels and thrombolytic activity, arthritis and inflammation, leukaemias and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  assays for receptor activity, arthritis and inflammation, leukaemias and C.N.S disorders.
Note: The sequence data for this patent did not form part of the printed specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ä

The present sequence is a cDNA clone HKGDL36 encoding human pituitary hormone, pituitrone. Pituitrone is highly expressed in pituitary gland and is also expressed in brain tissues, spinal cord and kidney. It may be used as antigens in the production of antibodies against pituitrone and in assays to identify modulators. Pituitrone and in seasys to identify modulators. Pituitrone cDNAs are also useful in gene therapy. Pituitrone may be used in the prevention, treatment and diagnosis of diseases associated with inappropriate pituitrone expression. It may be useful in treating disorders related to reproductive and renal system, immune disorders, disorders of haematopoietic cells (e.g., aneama, blgeorge syndrome, ataxia telangiectasia and Wiskott-Aldrich disorder), blood coagulation disorders, autoimmune disorders (e.g. Addison's disease, multiple sclerosis and systemic lupus extyhematosus (SLE)), hyperproliferative disorders (e.g. neoplasms of bone, liver and pancreas) and infectious

```
AXE AAF9417 to AAF94516 encode the human proteins given in AAB88557 to AAB88606 (I) which have a hydrophobic domain. (I) have immunosuppressant, anti-inflammatory and cytostatic activities, and can be costeopathic, anti-inflammatory and cytostatic activities, and can be used in gene therapy. (I) can be used as pharmaceuticals and as antigens to prepare antibodies. DNA and cDNA (II) encoding (I) can be used as producing (I) in large quantities. Cells containing (II) are used for producing (I) in large quantities. Cells containing (II) are used for the detection of ligands or receptors corresponding to membrane or secretory proteins and to screen small molecule novel pharmaceuticals. Chilbodies directed to (I) can be used for the detection, quantification and printification of (I). Activities of (I) may include cytokine and cell proliferation/differentiation function, immune stimulating or suppressing activity, haematopolesis regulating activity, tissue growth activity, activity, nematopolesis regulating activity, tissue growth activity, activity, and (II) can be used to treat autoimmune disorders e.g. multiple sclerosis, HIV infections, anaemia, burns, ulcers, osteoporosis, continuametory bowel disease and tumours. (I) and (II) can also be used for carbon or nitrogen source, to effect metabolism, carbohidam, anabolism, carbon or nitrogen source, to effect metabolism, carbohidam and unimune as an and an and act as antigens in vaccines to raise an immune response to the protein or another material cross-reactive with the protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 30 GCCCGGCTCGCTGGGGCACGATGGCGGGGTCGCCCCTCTGGGGGGCCCCGGGGG 89

The polynucleotide sequences given in AA298017 to AA298108 encode the human secreted proteins given in AA897064 to AAY87233 Human secreted proteins given in AA897064 to AAX87233 Human secreted proteins given in AA897064 to AAX87233 Human secreted protein can have activities based on the tissues and cells the genes are expressed in. Examples of activities include: cytostatic; immunosuppressive; antiinfalmmatory; nootropic; neuroprotective; and antiallargic. The polynucleotides and their corresponding secreted polypeptides are useful for preventing, treating or ameliorating medical conditions, e.g. by protein or gene therapy. Also pathological conditions can be diagnosed by determining the amount of the new polypeptides in a sample or by determining the presence of mutations in the new complete to developing products for the diagnosis or treatment of cancer, tumours, neurodegenerative disorders, developmental abnormalities and complement of entering and disorders blood disorders, diseases of the immune system, altergies, Alzheimer's disease, behavioural disorders, schizophrenia, catalorgies, Alzheimer's disease, behavioural disorders, schizophrenia, catalorgies, Alzheimer's disease, behavioural disorders, schizophrenia, cardiovascular disorders, reproductive disorders, gastrointestinal disorders, respiratory disorders and metabolic disorders. The proteins are also useful for identifying their the analytical completives or the proteins are also useful for identifying their the analytical completives.

AAD11630-AAD11721 represent CDNAs corresponding to 71 human secreted.

Crossista AAE06132 represent the proteins they encode.

AAE06133-AAE06205 represent human secreted protein fragments.

Crossista AAE06205 represent human secreted protein fragments.

Crossista AAE06133 represent the proteins they encode.

AE0613-AAE06205 represent human secreted protein fragments.

Crossista and their genes are useful for preventing, treating or ameliorating medical conditions, e.g., by protein or gene therapy.

Crossista and protein in a sample or by determining the presence of mutations in the new genes. Specific uses are described for each of the 71 genes, based on the tissues in which they are most highly expressed, and include developing products for the diagnosis or treatment of proliferative disorders, cancer, tumours, foetal and developmental abnormalities, haematopoietic disorders, diseases of the immune system, AIDS, autoimmune diseases (e.g., Alzheimer's disease, Parkinson's disease), cognitive disorders, schizophrenia, asthma, skin disorders (e.g., paoriasis), sepsis, diabetes, atherosclerosis, cardiovascular disorders, candiopenic disorders, independent disorders, madiophrenia, asthma, skin disorders, pregnancy-related disorders, endocrine disorders, and infections. The proteins can also be used to aid wound healing and epithelial cell corporate tissues, to identify their cognate ligands or binding to processes, and or percent skin adding the consular disorders, and consular disorders, corporate tissues, to identify their cognate ligands or binding to processes and consular disorders, consular disorders, and con

disorders are listed in the specification. The polypeptides can also be used to aid wound healing an epithelial cell proliferation, to prevent skin aging due to sunburn, to maintain organs before transplantation, for supporting cell culture of primary tissues, to regenerate tissues and in chemotaxis. The polypeptides can also be used as a food additive or preservative to increase or decrease storage capabilities. The present sequence encodes a novel human secreted protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; nootropic; immunosuppressant; cytostatic; gene therapy; cancer; peripheral nervous system; neuropathy; central nervous system; CNS; Alzheimer's; parkinson's disease; Huntington's disease; heamostatic; amyotrophic lateral sclerosis; Shy-Drager Syndrome; chemotactic;

The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral nervous system, such as peripheral nervous injuries, peripheral nervous system, such as peripheral nervous system diseases, such as alzaheimer's Parkinson's disease, Huntington's disease, such as alzaheimer's Parkinson's disease, Huntington's disease, such as utilisation of the activities auch as: Immune system suppression, activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, cancer diagnosis and therapy, drug screening, where the contains and inflammation, leukaemias and contains and the contains.

The invention relates to a novel method for diagnosing and detecting the progression of liver cancer, hepatocellular carcinoma or metastatic liver tumour in a patient, and differentiating metastatic liver cancer from hepatocellular carcinoma in a patient, involving detecting the level of expression of two or more genes represented in ABN93503-ABN97455 in a tissue sample. The method of the invention has hepatocropic, and cytostatic activity. The method is useful for diagnosing and detecting the progression of liver cancer, hepatocellular carcinoma and metastatic liver carcinoma in a patient. The method is useful for identifying expression profiles which serve as useful diagnostic markers as well as markers that can be used to monitor disease states, disease progression, drug efficacy and drug metabolism.

The present invention describes a method (M1) for screening for an anti-neoplastic agent. The method involves exposing cells to a chemical agent to be tested for anti-neoplastic activity, determining a change in expression of at least one gene (I) of a signature gene set, where (I) comprises a sequence (S) selected from 8447 sequences (given in ABL61664 to ABL70110), or is at least 95% identical to (S), where a change in extivity and can be used in gene therapy. MI can be used for screening an anti-neoplastic activity, (I) has cytostatic activity and can be used in gene therapy. MI can be used for screening an anti-neoplastic agent, and can be used for producing a product which is the data collected with respect to the anti-neoplastic agent as a result of MI, and the data is sufficient to convey the chemical structure and/or properties of the agent. MI can be used in the treatment of cancer such as colon, breast, stomach, lung, thyroid, coscophageal, ovarian, kidney, prostate or pancreatic cancer, adenocarcinoma, carcinoma, clear cell cancer, infiltrating ductal cancer, infiltrating ductal cancer, infiltrating ductal cancer, infiltrating ductal cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                703 CGCCGCCTCCGCCGTGCCGCCGACCACGATGTGGGCTCTGAGCTGCCCCTGAGGGCGTG 762
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               822

(COMP-) COMPUGEN INC.

Mintz L, Faigler S; Mintz E, Wasserman A, Shoshan A,

New oligonucleotide libraries comprising oligonucleotides which selectively hybridize to mRNAs transcribed from a transcription unit of a genome, useful for detecting tissue-', pathology-', and WPI; 2002-257383/30.

Example 1; SEQ ID 14889; 47pp; English.

developmental-specific genes

transcription units that populate a genome. The library comprises several oligonuclectides, each capable of hybridising selectively to a several oligonuclectides, each capable of hybridising selectively to a set of messenger RNA transcribed from a given transcription unit of the genome, which encodes one or more messenger RNA splice variants. The oligonuclectide libraries are useful for detecting mRNAs from a biological sample, in expression profiling studies, in qualitatively or quantitatively characterising the corresponding transcriptome, and in detecting RNA transcripts and splice variants of human or animal currently of transcripts and splice variants of human or animal confitcular biological transcripts of a sub-transcriptome under a particular biological or pathological state, and so allowing the detection of tissue and pathology-specific genes such as those genes only expressed in specific tissue under a specific pathological condition; to detect developmental specific genes; and to detect RNA transcripts and splice variants of a transcriptome of a patient suffering from a particular disorder. ABN27253 to ABN59589 represent The present invention describes oligonucleotide libraries for detecting messenger RNAs that populate a (sub-)transcriptome, where the (sub-)transcriptome comprises messenger RNAs transcribed from multiple the exemplification of the present invention.

N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wlpo.int/pub/published\_pct\_sequences.

NOTE: This is a 'working draft' sequence. It currently consists of 38 contigs. The true order of the places is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will

NOTE: Estimated insert size may differ from sequence length (see http://www.hgsc.bcm.tmc.edu/docs/Genbank_draft_data.html).
NOTE: This is a "working draft' sequence. It currently consists of 36 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

NOTE: This is a 'working draft' sequence. It currently consists of 53 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Submitted (15-SEP-2001) Human Genome Sequencing Center, Department of Molecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77030, USA (bases I to 111948) Worley, K.C.

Direct Submission

Submitted (13-MAY-2002) Wellcome Trust Sanger Institute, Hinxton, Cambridgeshire, CB10 15A, UK. E-mail enquiries:

Umquery@sanger.ac.uk Clone requests: clonerequest@sanger.ac.uk
On May 25, 2002 this sequence version replaced gi:21104114.

During sequence assembly data is compared from overlapping clones.

Where differences are found these are annotated as variations together with a note of the overlapping clone name. Note that the variation annotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with only a small overlap as described above.

This sequence was finished as follows unless otherwise noted: all regions were either double-stranded or sequenced with an alternate chemistry or covered by high quality data (i.e., phred quality >-30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by at least one plasmid subclone or more than one MI3 subclone; and the assembly was confirmed by restriction digest. The following abbreviations are used to associate primary accession numbers given in the feature table with their source databases: Em:, EMBL; Sw:, SWISSRROT; Tr:, TREMBL; WP:, MORMPEP; Information on the WORWPEP than their feature fails and with their source databases: Em:, EMBL; Sw:, Anderson on the WORWPEP.
